PROFILE SUMMARY

DevOps & Backend Engineer specializing in resilient, highly available infrastructure and backend systems. Experienced in designing Multi-AZ AWS architectures, building async API services with FastAPI, and automating CI/CD pipelines using GitHub Actions. Focused on implementing Infrastructure as Code (IaC) to streamline deployments and optimize system reliability.

KEY SKILLS

- **Cloud & Infrastructure:** AWS (EC2, S3, RDS, VPC, Lambda, CloudFront, CloudWatch), Terraform
- **CI/CD & Containers:** Jenkins, GitHub Actions, Docker, Podman, Buildah, Docker Compose
- **Automation & Scripting:** Bash, Python, Linux, Rclone
- **Database & Analytics:** SQL, PostgreSQL, MySQL, Pandas, PowerBI

PROJECTS

AWS Scalable Web Architecture (Vocal4Local Migration) 🐙 GitHub

AWS (Route 53, CloudFront, ALB, ASG, RDS Multi-AZ), Terraform, SOPS

- Eliminated 4 critical business risks (downtime, latency, data exposure, traffic surges) by migrating a legacy monolithic application to a 3-tier AWS architecture with Multi-AZ redundancy across 2 Availability Zones and global edge caching.
- Achieved defense-in-depth network security by isolating application and database layers in private subnets behind AWS WAF.
- Improved page load times for international users by serving static assets through CloudFront global edge caching.

Multi-Cloud Cost Hygiene Automation 🐙 GitHub

LocalStack, Terraform, Python, GitHub Actions, AWS (EC2, EBS, S3, VPC)

- Reduced cloud testing overhead by building a local-first cost detection workflow with LocalStack and Terraform, eliminating the need for real AWS infrastructure during development.
- Developed a Python janitor CLI to discover unattached EBS volumes, stopped EC2 instances, and unassociated Elastic IPs across 3 resource categories with dry-run and safe deletion modes.
- Standardized infrastructure validation across 7 pipeline stages by implementing a GitHub Actions CI/CD workflow automating Terraform checks and janitor reporting.

RankGuard – Async Transaction Processor & Leaderboard 🐙 GitHub

Python, FastAPI, PostgreSQL, SQLAlchemy 2.0, Alembic, Docker Compose, pytest

- Guaranteed exactly-once transaction processing across 4 database tables by building an async FastAPI backend with idempotency keys and per-user concurrency locks.
- Enabled multi-factor scoring across 3 transaction types (earn, spend, bonus) by implementing materialized rank computation with atomic SQLAlchemy snapshot updates.
- Streamlined deployment and schema consistency by containerizing with Docker Compose and automating PostgreSQL migrations via Alembic, validated by 8 tests.

IPL Cricket Data Analytics & Visualization 🐙 GitHub

Python (Pandas), Jupyter Notebook, PowerBI

- Performed exploratory data analysis on IPL datasets using Python (Pandas), identifying key performance trends and player statistics for data-driven insights.
- Built interactive PowerBI dashboards to visualize match outcomes, enhancing stakeholder reporting and visual storytelling.

EDUCATION

B.Tech in Computer Science and Engineering SRKR Engineering College, Andhra Pradesh, India

2023-2027

CGPA: 8.7/10

CERTIFICATIONS

- **AI-Powered Cloud Engineer & AWS Cloud Fundamentals** – EduSkills Foundation
- **CyberSecurity & Software Testing** – NPTEL
- **Advanced SQL** – HackerRank | **Google Project Management** – Coursera
