PROFILE SUMMARY

Cloud engineer experienced in designing multi-AZ AWS architectures, provisioning infrastructure with Terraform, implementing network security controls, and automating cloud operations. Built resilient, cost-efficient cloud solutions including scalable web architectures with global edge caching and automated resource lifecycle management. Focused on well-architected frameworks, infrastructure as code, and operational excellence.

KEY SKILLS

- **Cloud Infrastructure:** AWS (VPC, EC2, S3, RDS, Lambda, CloudFront, Route 53, CloudWatch), multi-AZ architecture
- **Infrastructure as Code:** Terraform, IaC, SOPS, infrastructure automation
- **Networking & Security:** VPC design, subnet segmentation, WAF, security groups, DNS, CDN
- **Automation & Scripting:** Python, Bash, Linux, GitHub Actions, Docker

PROJECTS

AWS Scalable Web Architecture (Vocal4Local Migration) 🐙 [GitHub](#)

AWS (Route 53, CloudFront, ALB, ASG, RDS Multi-AZ), Terraform, SOPS

- Eliminated 4 critical business risks (downtime, latency, data exposure, traffic surges) by migrating a legacy monolithic application to a 3-tier AWS architecture with Multi-AZ redundancy across 2 Availability Zones and global edge caching.
- Isolated application and database tiers across 3 private subnets behind AWS WAF, achieving defense-in-depth network segmentation.
- Reduced page load times for global users by serving static assets through CloudFront edge caching across 400+ points of presence.

Multi-Cloud Cost Hygiene Automation 🐙 [GitHub](#)

LocalStack, Terraform, Python, GitHub Actions, AWS (EC2, EBS, S3, VPC)

- Eliminated recurring cloud infrastructure costs during development by building a local-first cost detection workflow with LocalStack and Terraform, removing dependency on real AWS environments.
- Reduced risk of orphaned cloud resources by building a Python janitor CLI that detects 3 categories of idle assets (unattached EBS, stopped EC2, unassociated EIPs) with dry-run safety and Protected-tag skip.
- Standardized infrastructure validation across 7 pipeline stages by implementing a GitHub Actions CI/CD workflow automating Terraform checks and janitor reporting.

RankGuard – Async Transaction Processor & Leaderboard 🐙 [GitHub](#)

Python, FastAPI, PostgreSQL, SQLAlchemy 2.0, Alembic, Docker Compose, pytest

- Streamlined deployment and schema consistency by containerizing with Docker Compose and automating PostgreSQL migrations via Alembic, validated by 8 tests.
- Guaranteed exactly-once transaction processing across 4 database tables by building an async FastAPI backend with idempotency keys and per-user concurrency locks.
- Enabled multi-factor scoring across 3 transaction types (earn, spend, bonus) by implementing materialized rank computation with atomic SQLAlchemy snapshot updates.

EDUCATION

B.Tech in Computer Science and Engineering [SRKR Engineering College, Andhra Pradesh, India](#)
CGPA: 8.5/10

2023-2027

CERTIFICATIONS

- **AI-Powered Cloud Engineer & AWS Cloud Fundamentals** – EduSkills Foundation
- **CyberSecurity & Software Testing** – NPTEL
- **Advanced SQL** – HackerRank | **Google Project Management** – Coursera
